Problem

Find greatest integer that does not exceed $(a_{2006}^2 + a_{2007}^2)/(a_{2006}a_{2007})$ where $a_0 = a_1 = 3, a_{n-1}a_{n+1} = a_n^2 + 2007$.

Chain of Thought

[progress] Okay, so I need to solve this problem...

[progress] **First,** when n=1, ... so a_2 is 672...

[progress][N2] **Similarly,** for n=3, $a_2a_4 = a_3^2 + 2007$...

[review][N3] **Wait**, that's going to be a huge number. Maybe this approach is not practical for computing up to a_{2007}. There must be a smarter way...

[progress][N4] **Another angle,** let's consider taking logs. If the sequence grows rapidly, maybe logarithmically it's linear? ...

[progress][N5] **Hmm,** perhaps this expression simplifies? ... $x + 1/x$ where $x = a_n/a_{n+1}$.

[progress][N6] But first, let's see if we can find a recurrence relation for the ratios...

[progress][N7] **Alternatively,** let's consider the reciprocal...

[review] **Hmm,** not sure if this helps. Maybe this is getting too complicated...

[progress][N8] **Alternatively,** let's look for a pattern in the terms we have: ...

[progress][N9] **Let me check** if the ratio $r_n = a_{n+1}/a_n$ is approaching some limit...

[review][N10] **Hmm**. Maybe instead of looking at the terms, look at the expression we need to compute...

[progress][N11] If we can find a recurrence relation for S_n, then maybe we can compute it recursively. **Let's see**...

[progress][N12] **Alternatively**, since $S_n = r_n + 1/r_n$, and we can express r_n in terms of previous terms. Let's try to compute S_0, S_1, S_2, etc., to see if there's a pattern...

[review] **Wait**, let me double check...

[progress][N15] So the pattern seems that S_n approaches 225 as n increases, but is always slightly less than 225...

[progress] But we need to confirm this rigorously. Maybe we can prove that S_n is always less than 225 and approaches 225 as n approaches infinity...
